# Efficient renaming in Conflict-free Replicated Data Types (CRDTs)

Case Study of a Sequence CRDT: LogootSplit

Matthieu Nicolas (matthieu.nicolas@loria.fr), Gérald Oster, Olivier Perrin COAST team

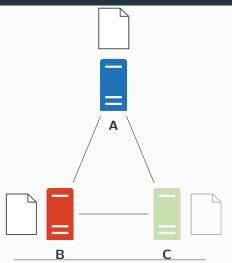

December 12, 2021

 Replicated data structure

#### Research issue

Evergrowing overhead: impacts memory, bandwidth and CPU

**Figure 4:** Memory footprint of the data structure

• Operation count: 100k

• Size of content: 100KB

• Size of data structure: 20MB

How to reduce the overhead introduced by the data structure?

#### Our approach

Reassign shorter identifiers and aggregate them into blocks in a fully distributed manner

## Renamable Logo ot Split

- Propose RenamableLogootSplit, LogootSplit with a rename operation
- Can be performed without coordination

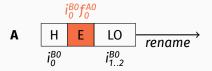

Figure 5: Example of renaming

#### Renamable Logoot Split

- Propose RenamableLogootSplit, LogootSplit with a rename operation
- Can be performed without coordination

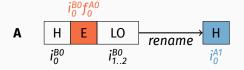

Figure 5: Example of renaming

 Generates a new identifier for the first element, based on its previous identifier

#### RenamableLogootSplit

- Propose RenamableLogootSplit, LogootSplit with a rename operation
- Can be performed without coordination

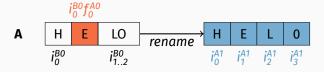

Figure 5: Example of renaming

- Generates a new identifier for the first element, based on its previous identifier
- Then generates contiguous identifiers for all following elements

#### RenamableLogootSplit

- Propose RenamableLogootSplit, LogootSplit with a rename operation
- Can be performed without coordination

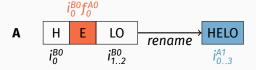

Figure 5: Example of renaming

- Generates a new identifier for the first element, based on its previous identifier
- Then generates contiguous identifiers for all following elements

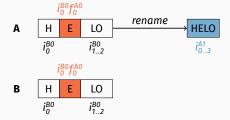

Figure 6: Applying naively concurrent update

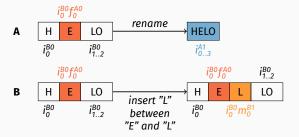

Figure 6: Applying naively concurrent update

 $\bullet$  Can issue operations concurrently to  $\emph{rename}$ 

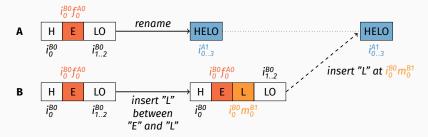

Figure 6: Applying naively concurrent update

• Can issue operations concurrently to rename

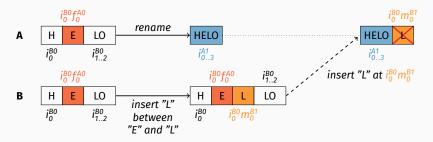

Figure 6: Applying naively concurrent update

- Can issue operations concurrently to rename
- Produce inconsistencies if applied naively

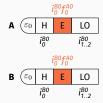

Figure 7: Handling properly concurrent update

• Use epoch-based system to track concurrent operations

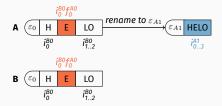

Figure 7: Handling properly concurrent update

• Use *epoch-based* system to track concurrent operations

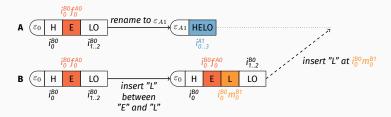

Figure 7: Handling properly concurrent update

• Use *epoch-based* system to track concurrent operations

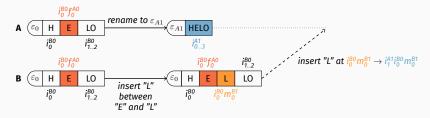

Figure 7: Handling properly concurrent update

- Use epoch-based system to track concurrent operations
- Use transform operations against *rename* ones (OT)

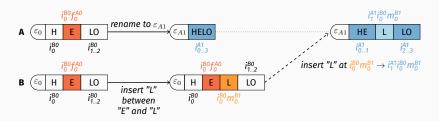

Figure 7: Handling properly concurrent update

- Use epoch-based system to track concurrent operations
- Use transform operations against *rename* ones (OT)

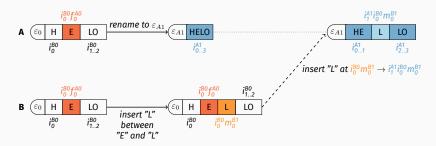

Figure 8: Concurrent rename operations leading to divergent states

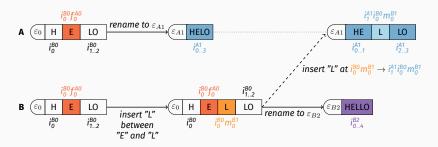

Figure 8: Concurrent rename operations leading to divergent states

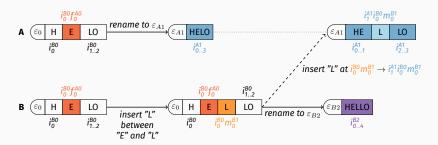

Figure 8: Concurrent rename operations leading to divergent states

• Rename operations are system operations

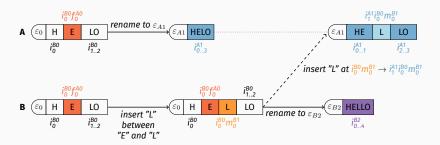

Figure 8: Concurrent rename operations leading to divergent states

- Rename operations are system operations
- Can resolve conflict by only applying one of them

#### How to do so?

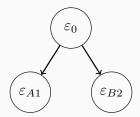

Figure 9: Epoch tree corresponding to previous scenario

#### How to do so?

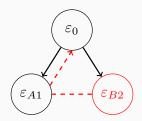

Figure 9: Epoch tree corresponding to previous scenario

- Have to pick an epoch as the target one
  - Define total order on epochs

#### How to do so?

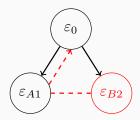

Figure 9: Epoch tree corresponding to previous scenario

- Have to pick an epoch as the target one
  - Define total order on epochs
- Have to move through the tree
  - Design transformation function to revert *rename* operation

#### Applying concurrent rename operations

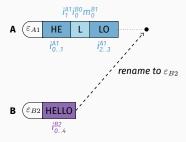

Figure 10: Applying a concurrent rename operation

#### **Applying concurrent rename operations**

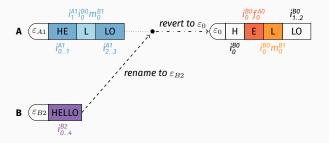

Figure 10: Applying a concurrent rename operation

• Revert state to equivalent one at LCA epoch

#### **Applying concurrent rename operations**

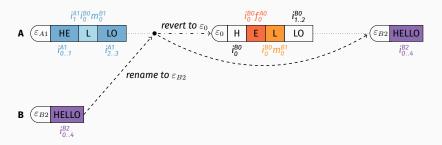

Figure 10: Applying a concurrent rename operation

- Revert state to equivalent one at LCA epoch
- Apply then rename operations leading to target epoch

#### **Downsides**

#### Need to store former state until no more concurrent operations

- Can garbage collect it once the *rename* operation is causally stable<sup>[3]</sup>
- Can offload it to the disk meanwhile

#### Need to propagate former state to other nodes

- Can compress the operation to minimise bandwidth consumption
- Can trigger rename operations at a given number of blocks

# Evaluation

Ran simulations to compare performance of

RenamableLogootSplit to LogootSplit one

#### **Scenario**

- Simulate collaborative editing sessions using either LogootSplit or RenamableLogootSplit
- Phase 1 (content generation): 80/20% of insert/remove
- Phase 2 (editing): 50/50% of insert/remove
- Nodes switch to phase 2 when document reaches critical size (15 pages 60k elements)

### **Results - Convergence**

- Compared final content of nodes per sessions
- Did not observe any divergence
- Empirical result, not a proof...
- ... but represents first step towards the validation

# **Results - Memory footprint**

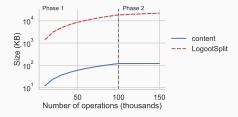

Figure 11: Evolution of the size of the document

# **Results - Memory footprint**

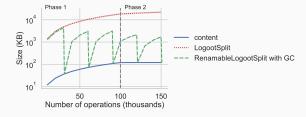

Figure 11: Evolution of the size of the document

• Rename resets the overhead of the CRDT, if can garbage collect

# **Results - Memory footprint**

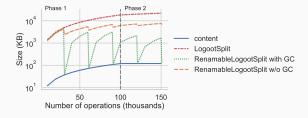

Figure 11: Evolution of the size of the document

- Rename resets the overhead of the CRDT, if can garbage collect
- Rename still reduces by 66% the size otherwise

### Results - Integration time of insert operations

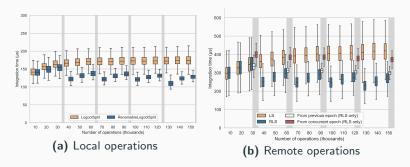

Figure 12: Evolution of the integration time of insert operations

# **Results - Integration time of insert operations**

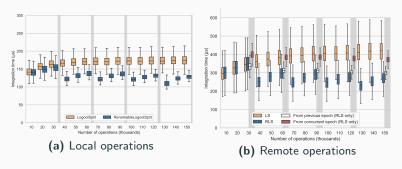

Figure 12: Evolution of the integration time of *insert* operations

• Rename reduces integration times of future operations

# Results - Integration time of insert operations

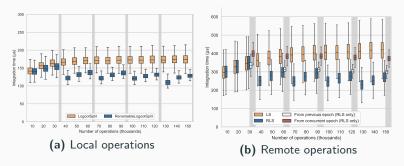

Figure 12: Evolution of the integration time of *insert* operations

- Rename reduces integration times of future operations
- Transforming concurrent operations is actually faster than applying them on former state

# Results - Integration time of rename operations

Parameters		Integration Time (ms)

- Noticeable by users
- Need to improve remote integration time

### **Conclusion**

#### Done

- Designed a new Sequence CRDT : RenamableLogootSplit
- Validated it through experimental evaluation

### Conclusion

#### Done

- Designed a new Sequence CRDT : RenamableLogootSplit
- Validated it through experimental evaluation

#### Work in progress

- Publishing it
- Writing the manuscript

### Conclusion

#### Done

- Designed a new Sequence CRDT : RenamableLogootSplit
- Validated it through experimental evaluation

#### Work in progress

- Publishing it
- Writing the manuscript

#### To do

- Prove formally the correctness of the mechanism
- Design better strategies to select the target epoch
- Improve performance of *rename* operations

Thanks for your attention, any questions?

# LogootSplit identifiers

 To comply with these constraints, LogootSplit proposes identifiers composed of quadruplets of integers of the following form:

$$position_{offset}^{node\_id \ node\_seq}$$

- position allows to determine the position of this identifier compared to others
- node\_id refers to the node's identifier, assumed to be unique
- node\_seq refers to the node's logical clock, which increases monotonically with local operations
- offset refers to the element position in its original block

#### Identifier constraints

• To fulfill their role, identifiers have to comply to several constraints:

#### Globally unique

• Identifiers should never be generated twice, neither by different users nor by the same one at different times

#### Totally ordered

 We should always be able to compare and order two elements using their identifiers

#### Dense set

 We should always be able to add a new element, and thus a new identifier, between two others

#### Related work

- Core-nebula approach<sup>[4]</sup>
  - Reassigns shorter identifiers to elements. . .
  - ... but requires consensus
- LSEQ<sup>[5]</sup>
  - Set of strategies to reduce the growth of identifiers . . .
  - ... but overhead still proportional to number of elements

### **Perspectives**

### Propose a strategy to avoid conflicting rename operations

 How to minimise likelihood of concurrent rename operations without coordinating?

### Propose a smarter strategy to choose the "winning" renaming

• How to minimise the overall computations?

# Results - Integration time of rename operations (complete)

Parameters	Integration Time (ms)				
Туре	Nb Ops (k)	Mean	Median	99 <sup>th</sup> Quant.	Std

	150	5.53	5.26	8.70	0.79

Table 2: Integration time of rename operations

### **Experimental settings**

- Use Node.js version 13.1.0
- Obtained documents sizes using our fork of object-sizeof [6]
- Ran benchmarks on a workstation equipped of a Intel Xeon CPU E5-1620 (10MB Cache, 3.50 GHz) with 16GB of RAM running Fedora 31
- Measured times using process.hrtime.bigint()

<sup>[6]</sup>https://www.npmjs.com/package/object-sizeof
